

So I am going to take you through the system currently as it is and highlight a few things here and there that will give you pointers on how the system is coming up. So basically we have the landing page, refer to the screenshot below.

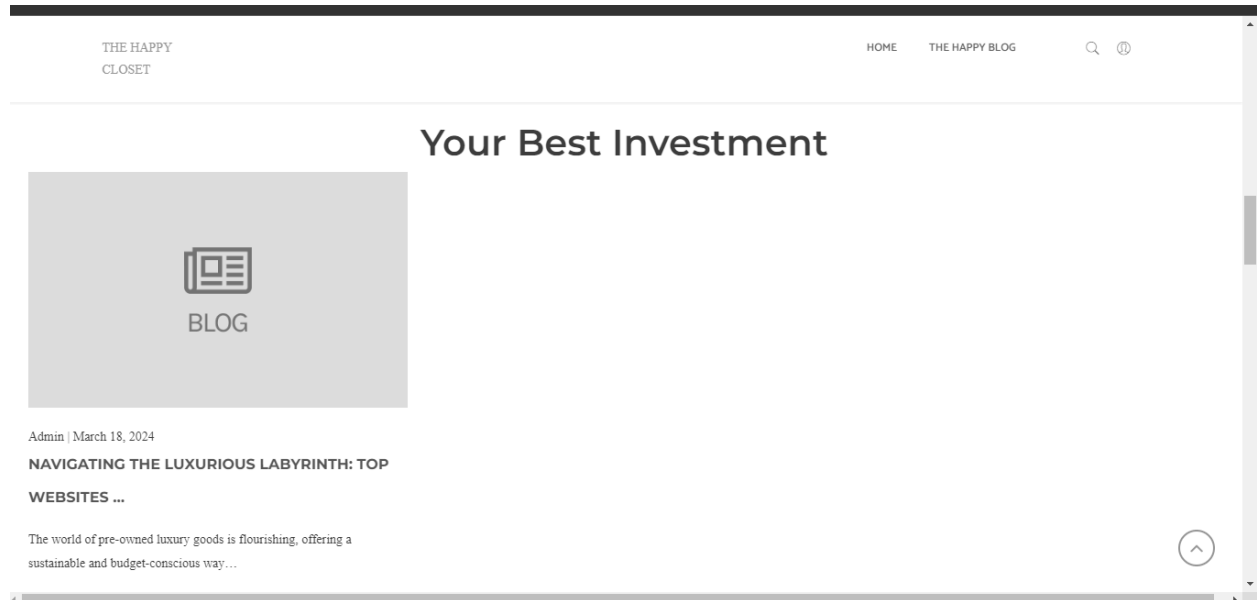

This is the first thing users will see when they visit your website. Just below, I have put a feature section which shows 6 featured products from the products catalogue that will be random every day.

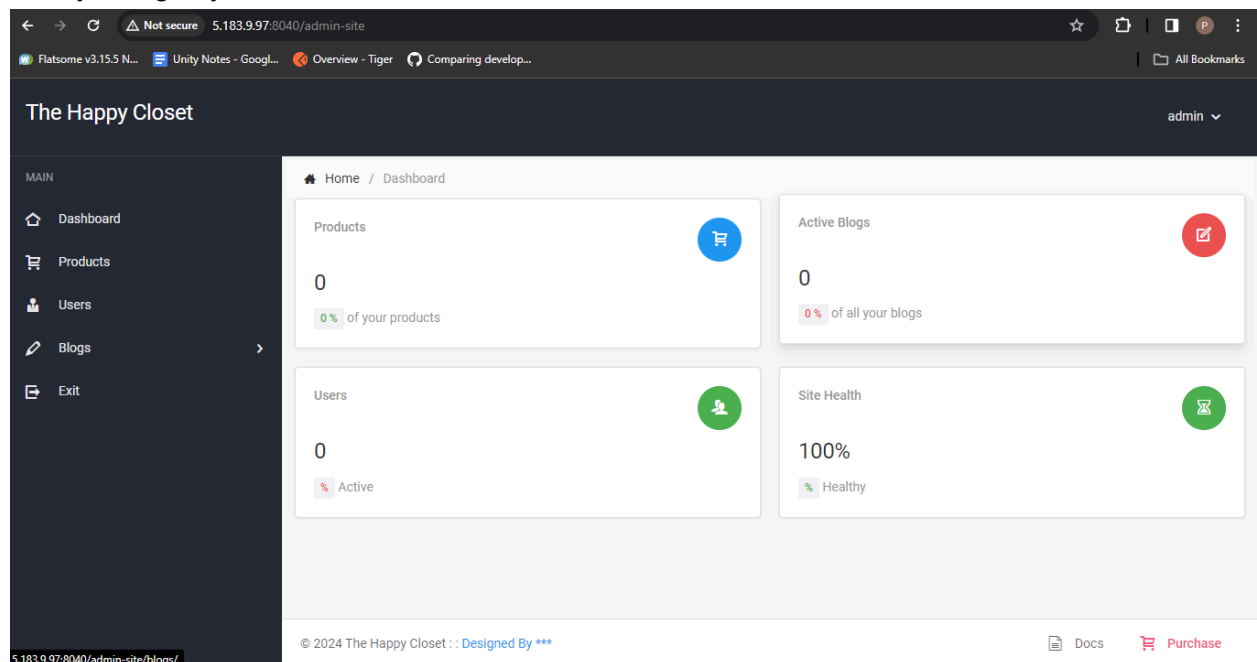

Then under that we have your blogs. These blogs are controlled by you in the admin panel. Am going to talk more about this later on.

Finally we have the other sections which I have tried to design & copy your current site as it.

## The Admin Panel

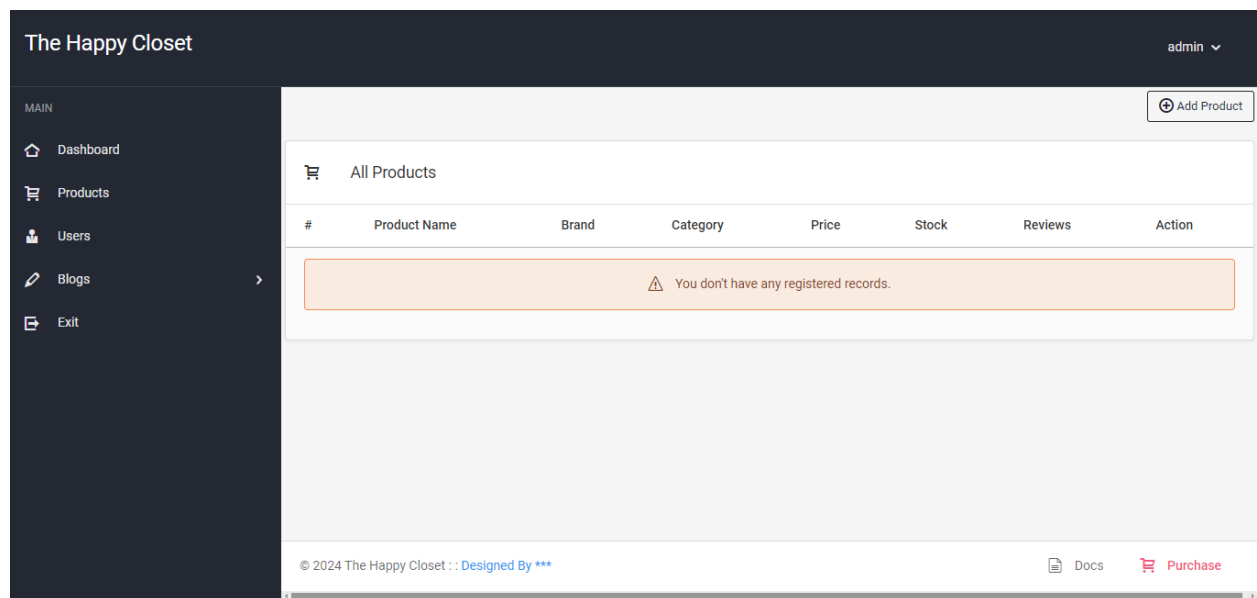

This is where things get a little be complex, but I can assure you, it's simple. After you login, you have the dashboard.

This dashboard is just a snippet / analysis of everything. We have

- Products
- Users
- Blogs

Products is a page that lists all products that are currently listed on your site. The Engine am currently working on will be constantly crawling the sites you gave me, syncing the products there, with your database, and all the synced products/bags will appear on this page. As the admin/owner of the site, you can use this page to manipulate the products/bags, delete products/bags and observe what is listed for comparison on your site. In a nutshell, this page gives you 100% control over what customers see for comparison. It's the most important page on your site.

You had a question about the add product button. So I was thinking, Maybe from time to time you would like to manually add a product/bag into the comparison listing. That's where that button comes in.

Get me correct, the engine will still be doing the syncing and scrapping and all, you just have the flexibility to add your own products that , maybe you found somewhere and would like them to be in your listing.

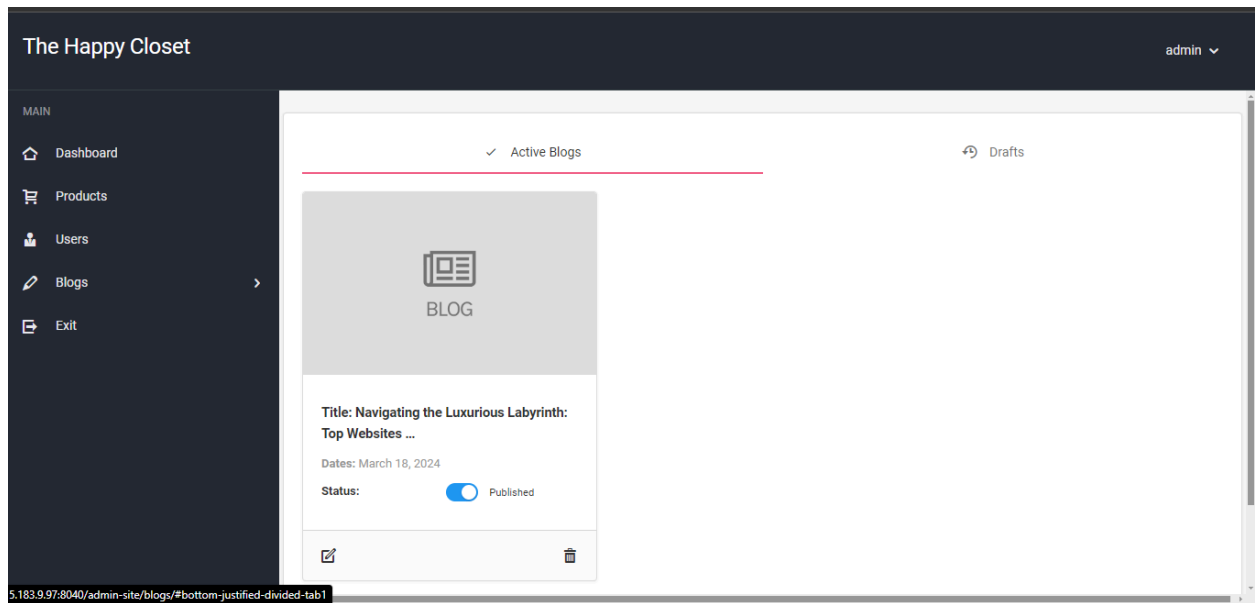

The users page is a page showing all users that will sign up and create an account on your site. This data will be important especially when we start sending out newsletters.

Finally we have the blogs:

Under blogs we have two options. Add blog and list blogs.

So this is where you manage the blogs that are in your site.

List blog is pretty straight forward, as this is where you view all your blogs, both active and draft.

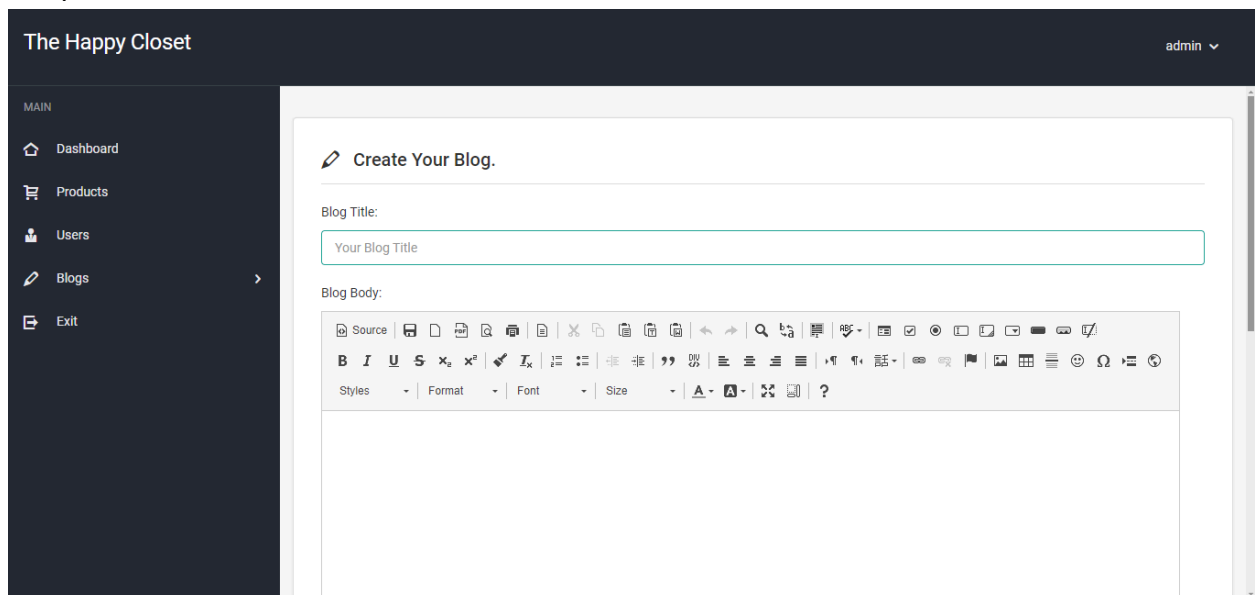

You can always switch between active and draft blogs using the tabs at the top. Draft blogs won't be visible to users on the front page. Active blogs are visible to users. Use the toggle button to change the draft status. Of course the edit and delete buttons are standard.

### How do you add blogs to your site;

This is where the create blogs comes in.

This page might seem simple but trust me, You have everything you need to create blogs on that panel.

So the first thing is to give your blog a title. This is the tag line / blog title that will feature on the front page. The body is where the actual content of the blog goes.

You have a list of options at the top and these options are everything you need. It's more or less like a mini-(Microsoft-Word). You can bold, italicize, indent, add links, change font color, font sizes, underline, add lists, bullets and the list is long. You can create your own world there. Just play with it and see what I'm saying. Once you are done. Hit the save button and the blog will be published.

Meanwhile, when the engine is done (the hardest part of the system) Everything will come into place smoothly, I am sure you will like it.

Regards.
